

## Ralph's Solver Training

by Anil Arya and Richard A. Young

Ralph wants you to help him solve two mathematical programming problems using Excel. For Problem 1, he has provided detailed instructions for you to follow.

### Problem 1:

$$\begin{aligned}
 &\text{Max} && 6x_1 + 2x_2 \\
 &\text{subject to:} && 2x_1 + x_2 \leq 100 \\
 &&& x_1 + 3x_2 \leq 120 \\
 &&& x_1, x_2 \geq 0
 \end{aligned}$$

Below are Ralph's instructions.

#### A. Setting Up the Parameters in the Spreadsheet:

1. Start up Excel. Open up a new spreadsheet.
2. Enter the objective function coefficients in cells A5 and B5. See Tables 1 and 2 below for input display.
3. Enter the coefficients on  $x_1$  and  $x_2$  respectively for the left-hand side of the first linear constraint in cells A8 and B8. Repeat for the second constraint in row 9. This set of constraints forms a 2-by-2 matrix. Enter the right-hand side of the respective constraints in cells C8 and C9.

#### B. Enter the Data into the Spreadsheet in the Form to be Used by Solver:

1. Place trial values in cells A14 and B14. I chose 15 and 60. For linear programs, these are purely arbitrary — they don't even have to satisfy the constraints. However, for nonlinear programs it is a good idea to start in the right "ballpark" (see Problem 2 below). After you run Solver, these cells will contain the solution.
2. Enter the linear objective function in cell A16, referring to the cells used for the parameters in Step A.2 and for the trial values in Step B.1. I chose to use the SUMPRODUCT function, which is sometimes referred to as the "dot product", but you can type it out the long way using multiplication and addition signs if you would like.
3. Enter the left- and right-hand side of the constraints, referring to the cells used for the parameters in Step A.3. For the first constraint they are placed in cells A19 and B19, respectively. Repeat for the other constraint in row 20. I again chose to use the SUMPRODUCT function.

Tables 1 and 2 display the spreadsheet. Table 1 shows you what should appear in the formula boxes. Table 2 displays what the spreadsheet looks like in the normal default mode - this is what things should look like just before you run Solver.

1	PARAMETERS:			
2				
3	obj fcn coeffs			
4		x1	x2	
5	6		2	
6				
7	A-matrix		capacity	
8	2	1	100	resource 1
9	1	3	120	resource 2
10				
11	SOLUTION:			
12				
13		x1	x2	
14	15		60	variables
15				
16	=SUMPRODUCT(A5:B5,A14:B14)			obj fcn value
17				
18		LHS	RHS	
19	=SUMPRODUCT(A8:B8,A14:B14)		=C8	constraint 1
20	=SUMPRODUCT(A9:B9,A14:B14)		=C9	constraint 2

Table 1: Setting up the Spreadsheet (Formulas view)

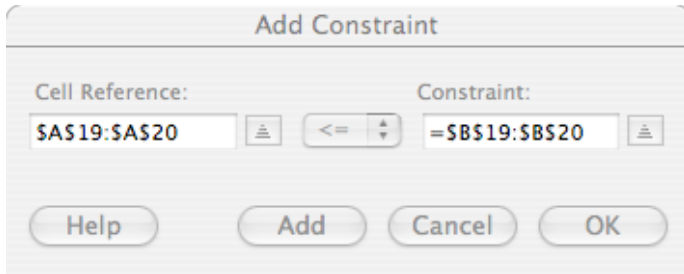

1	PARAMETERS:			
2				
3	obj fcn coeffs			
4		x1	x2	
5	6		2	
6				
7	A-matrix		capacity	
8	2	1	100	resource 1
9	1	3	120	resource 2
10				
11	SOLUTION:			
12				
13		x1	x2	
14	15		60	variables
15				
16	210			obj fcn value
17				
18		LHS	RHS	
19	90	100		constraint 1
20	195	120		constraint 2

Table 2: Setting up the Spreadsheet (Default view)

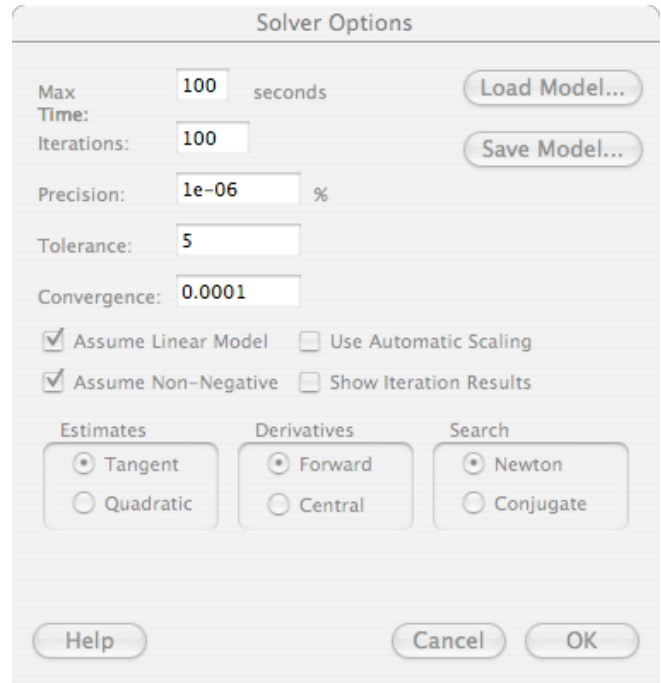

#### C. Initializing and Running Solver:

1. Select Solver from the Tools menu. Solver will use the parameters as its inputs. On the screen will appear the Solver Parameters window, which will appear as shown in Table 5 when you are all done.
2. Place the cursor in the Set Target Cell box and click on cell A16. This is a maximization problem, so make sure Max is selected.

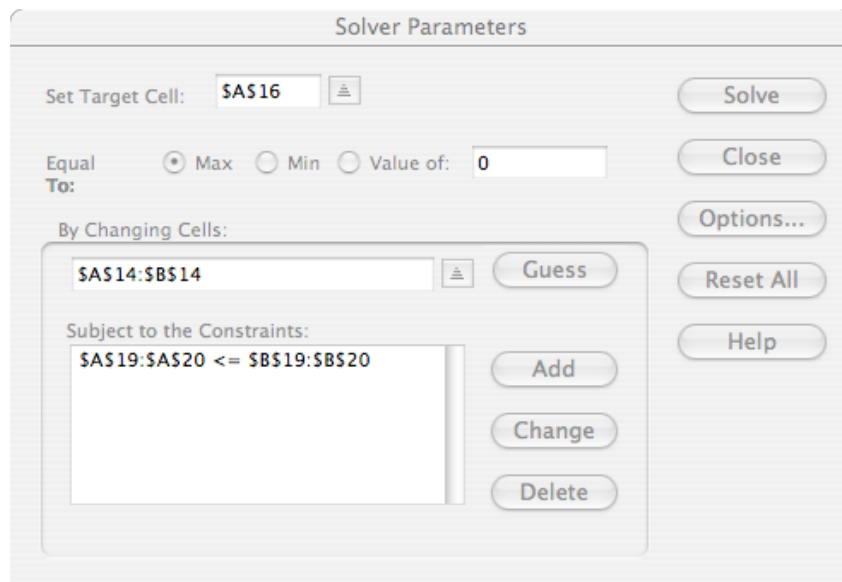

- Type A14:B14 in By Changing Cells box or place the cursor in the box and drag your mouse over the cells.
- To build the constraints click Add. The Add Constraint window will appear as in Table 3. Type A19 in the Cell Reference box. The direction of the inequality should be set at  $\leq$  for the first constraint. Type B19 in the Constraint: box. Click Add to keep adding constraints. You also can drag down to enter the left- and right hand sides, but the inequalities must all go in the same direction – this is what is shown in Table 3. A blank Add Constraint window will reappear. To stop adding constraints click OK.
- From the Solver Parameters window (Table 5) select the Options box, which will appear as in Table 4). Then select Assume Linear Model (this will make the program run more efficiently). Also select Assume Non-Negative (this is important). Click Okay to return to the Solver box.

**Table 3: Add Constraint Window**

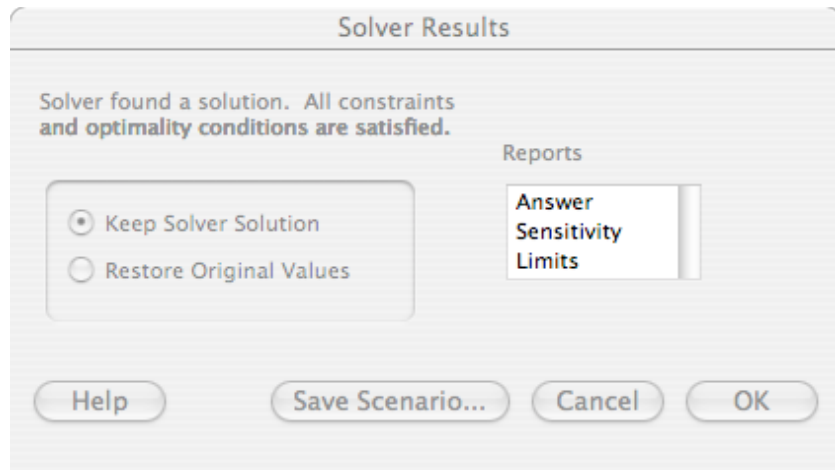

**Table 4: Solver Options Window**

**Table 5: Solver Window for Completely Specified Model**

- Table 5 displays the Solver window for the model. Note the software has inserted dollar signs in cell labels; you did not need to do that yourself. Now you are ready to solve the LP. Click Solve. If the solution looks a little messy, run Solver again, with the current solution as the starting solution.

**Table 6: Results Window for Solver**

D. Sensitivity Analysis:

1. If you've done everything okay, a window should appear with the message "Solver found a solution. All constraints and optimality conditions are satisfied." (See Table 6 above.) Alternatively, you may get a message indicating that you need to run more iterations. This is unlikely with an LP of the size we'll be dealing with, but may occur if you run a non-linear program (see Problem 2 below). If this happens, click "OK" and then select Solve again, with the current solution as the starting solution. If you get a more troublesome message, such as "the problem has not converged," etc., you probably have entered the problem incorrectly. Make sure that it's maximizing if that's what you want to do. Check you have entered the objective function and constraints correctly. Make sure the direction of the inequalities is correct. Make sure you have chosen Assume Non-Negative.
2. Try selecting from within the Reports section of the Solver Results window one or more of: Answer, Sensitivity, and Limits. For example, if you select Sensitivity, a window will appear as in Table 7 below. This report is automatically placed into a separate Excel Sheet titled "Sensitivity Report". You see the "shadow prices" are 3 on the first resource constraint and zero on the second. We will talk about shadow prices quite a bit in this course, and you will continue to do so in BUS-ADM MGT 331 and BUS-ADM MGT 630.

1	Microsoft Excel 11.4 Sensitivity Report						
2	Worksheet: [r_solver_training.xls]in program (1)						
3	Report Created: 6/26/2008 8:49:17 AM						
4							
5							
6	Adjustable Cells						
7			Final	Reduced	Objective	Allowable	Allowable
8	Cell	Name	Value	Cost	Coefficient	Increase	Decrease
9	\$A\$14	x1	50	0	6	1E+30	2
10	\$B\$14	x2	0	-1	2	1	1E+30
11							
12	Constraints						
13			Final	Shadow	Constraint	Allowable	Allowable
14	Cell	Name	Value	Price	R.H. Side	Increase	Decrease
15	\$A\$19	LHS	100	3	100	140	100
16	\$A\$20	LHS	50	0	120	1E+30	70
17							

**Table 7: Results of Sensitivity Analysis**

3. Now click on "Sheet 1", which will appear as in Table 8 below. The optimal solution is:  $x_1 = 50$ ,  $x_2 = 0$ , and the objective function is 5,000. Well done!

1	PARAMETERS:			
2				
3	obj fcn coeffs			
4	x1	x2		
5	6	2		
6				
7	A-matrix		capacity	
8	2	1	100	resource 1
9	1	3	120	resource 2
10				
11	SOLUTION:			
12				
13	x1	x2		
14	50	0		variables
15				
16	300			obj fcn value
17				
18	LHS	RHS		
19	100	100		constraint 1
20	50	120		constraint 2

Table 8: Successfully Run Program

**Problem 2:**

This one is based on Examples 2.2 and 2.6 in Demski, *Managerial Uses of Accounting Information*. It will be helpful to you when we get to chapter 2.

$$\begin{aligned}
 \text{Min} \quad & 5z_1 + 20z_2 \\
 \text{subject to:} \quad & \sqrt{z_1 z_2} \geq q \\
 & z_1 \leq 15 \\
 & z_1, z_2 \geq 0
 \end{aligned}$$

Try running the example for six cases:  $q = \{0, 5, 10, 15, 20, 25\}$ . This involves running solver six times. Don't forget to extract the shadow prices for each case. What do you observe?

Solver hints:

- (1) notice this is a minimization problem
- (2) because of the square root in the first constraint, you probably should try positive values for your starting solution.
- (3) in the previous example Assume Linear Model was selected, because that was a *linear* program. For this *nonlinear* program, you should go into Options and make sure you have *not* selected Assume Linear Model. The other options are normally fine to leave at their default settings.
- (4) when you enter the left hand side of the first constraint into the objective function cell you will want to make use of the SQRT function under the Insert menu, or type in " $(z_1 z_2)^{(1/2)}$ ".
